

National Science Month continuation through YouTube short video series: Scripts

For YT shorts to have a chance at catching the algorithm, it would be important to maintain portrait format, less than 60 second delivery, and be catchy. Catchy can mean to be emotionally meaningful, humorous, informative, expressive, playful, or a combination of these approaches.

I propose we try a few different approaches and see which gain the most traction. Engaging script. Clear visuals. Call to action.

Format will be Jo Marais speaking directly into the camera, and overlaid onto the same background as the How-To pilot video

Standard introduction:

- Hello good people! Just a local neuro-nerd thinking about Neurotech in Society.

Standard outro:

- In the Darkroom project, Wits NeuRL is funded by merSETA to shed light on neurotechnology and the future of work. Got some thoughts you care to share? Spotlight your questions in the comments or email us at neurol-darkroom@proton.me

Neurotechnology: the Science, the Technology, the Innovation

- *The brain contains more information transfer points than there are galaxies in the universe!*
- *That information is transferred across cells called neurons, and this info transference generates energy. Power. Biological electricity.*
- *The energy of the brain can be measured without ever opening the scalp. Neurotechnology does just that: a glimpse into brain activity using external technological devices.*
- *These technologies can tell us what is happening in which parts of the brain and when.*
- *In the growing era of AI, neurotech can be applied to our internal and external worlds.*

The path of movement between science, society, and skills sectors

- *Knowledge and information is constantly moving in all directions. In its simplest terms, for information to move from A to B, we need point A, point B, and a path of movement.*
- *Neurotech in science? Point A. Neurotech in industry? Point B.*
- *A project that makes scientific recommendations that are delivered into societal education and industry training? The path of movement!*
- *This requires that the path of movement of information is not unidirectional, but multidirectional: society informing science; industry informing policy; people informing people.*

Feasibility of neurotech in SA

- *When I say "neurotechnology", what is the first thing that comes to mind?*
- *To stitch together a unified concept of neurotechnology will take time*
- *Neurotechnology could be helpful for studying the nervous system's signals that highlight brain activity, behaviour and emotion.*
- *What do we already know? Who developed those ideas? Why is it not reasonable to apply research that exists internationally to all contexts? Can we build a local understanding of neurotechnology, informed by the public and developed for the public, to make neurotechnology feasible in South Africa?*

Neurotech skills development

- *The Process. The Person. The Power. These are three corners that shape neurotechnology skills development.*
- *Different industries, sectors, social spaces ask for different neurotechnologies to be applied. That's the process. Okay, cool, but who applies them?*
- *That's the person. People in skilled work will likely be trained in two ways: with neurotechnology by their side, or with neurotechnology in their hands.*
- *Who makes those calls? That's the power. Power is always an imbalance. Redistributing power appropriately to shape the future of neurotech in society is not a consideration - it's the whole point!*

Neurotech ethics and risk

- *Ethics are the principles that decide how you navigate the world. Bioethics, for example, is a global standard for research practice that says ethical research does no harm, benefits all, is carried out with justice, and provides people with the power to say no.*
- *The world has its own ethics too, and sometimes... this goes right out the window. As neurotech in society gains its place, it's important that policy, the public, manufacturers, employees and researchers decide together what will fly, and what will not.*
